

9.1.2 Plindrome or Not

Algorithm

Step 1: Start

Step 2: Input a string `st`

Step 3: Find length of string $\rightarrow l = \text{len}(st)$

Step 4: Initialize flag `f = True`

Step 5: Set loop from `i = 0` to `l-1`

Step 6: Compare `st[i]` with `st[l - 1 - i]`

Step 7: If not equal $\rightarrow$ set `f = False` and break loop

Step 8: Repeat steps until loop ends

Step 9: If `f == True` $\rightarrow$ print "Palindrome"

Step 10: Else $\rightarrow$ print "Not a Palindrome"

Step 11: Stop

Flowchart

9.1.2. Palindrome or Not

Write a Python program to take a string as input and check whether the given string is a palindrome or not. A palindrome is a string that reads the same forwards and backward.

Input Format:

- A single line of input contains a string

Output Format:

- If the input string is a palindrome, print "Palindrome", otherwise print "Not a Palindrome"

palindro...

```
1 # Type your code here...
2 st = input()
3 l = len(st)
4 f = True
5 for i in range(1):
6     if st[i] != st[l - 1 - i]:
7         f = False
8         break
9 if f:
10     print("Palindrome")
11 else:
12     print("Not a Palindrome")
```

Average time	Maximum time
0.003 s	0.008 s
3.40 ms	8.00 ms

2 out of 2 shown test case(s) passed
3 out of 3 hidden test case(s) passed

Test case 1 8 ms Debug

Expected output

palindro

Actual output

palindro

Test case 2 3 ms
