

10.1.2 Reverse a String

Algorithm

Step 1: Start

Step 2: Input string `st`

Step 3: Initialize `rev_st = ""`

Step 4: Find length of string

Step 5: Traverse string from last index to first

Step 6: Add each character to `rev_st`

Step 7: Print original and reversed string

Step 8: Stop

Flowchart

10.1.2. Reverse a String

Write a Python program that prints the reverse of a given input string. The program uses a `reverse_string()` function that takes a string as input and returns its reversed string.

Input Format:

- The program prompts "Enter a string: " and reads a string representing the string to be reversed.

Output Format:

- The first line prints the original string, in the format:

Original String: <input_string>

- The next line prints the reversed string, in the format:

Reversed String: <reversed_string>

ReverseS...

1 v def reverse_string(st):

2 -> rev_st = ""

3 -> l = len(st)

4 v -> for ch in range(l-1, -1, -1):

5 -> rev_st = rev_st + ch

6 -> return rev_st

7

8 user_input = input("Enter a string: ")

9 result = reverse_string(user_input)

10 print(f"Original String: {user_input}")

11 print(f"Reversed String: {result}")

Average time

0.004 s

3.75 ms

Maximum time

0.006 s

6.00 ms

2 out of 2 shown test case(s) passed

2 out of 2 hidden test case(s) passed

Test case 1 6 ms

Expected output

Enter a string: PythonProgramming

Original String: PythonProgramming

Reversed String: gniMmargorPnohtyP

Actual output

Enter a string: PythonProgramming

Original String: PythonProgramming

Reversed String: gniMmargorPnohtyP
